As we can see above, red wine has less total sulfur dioxide than white wine does.

Above is a table of linear model. The left has our prediction, and the top has the actual values. As we can see we have 8 datapoints that we misinterpret. This is out of 1625 which is very good.

```
pred = predict(model_lm, x_test, onlySL = TRUE)

Now we have a linear model, but utilizing SuperLearner. Superlearner does a lot of additional optimizations with the datasets. We can see above that there are 0 datapoints misidentified.
